

Solution Architecture Canvas: The "How"

Project Name: _____ Date: _____

1. The Core Proposition & Solution

How are we solving the synthesized problem from Part 1?

A. Unique Value Proposition (UVP): *(A single, clear, compelling message that states why your solution is different and worth buying. What is the core promise?)*

B. The High-Level Solution: *(Outline the top 3 core features or capabilities that will deliver the Desired State from your Problem Canvas.)*

1. _____
2. _____
3. _____

2. Market Execution

How will this reach the customer and sustain itself?

A. Channels: *(Exactly how will you reach your Primary Actor to sell this? e.g., Local farmer meetups, direct WhatsApp outreach, BNI referrals)*

B. Unfair Advantage: *(What do you have that cannot be easily copied or bought by a competitor? e.g., Exclusive partnerships, insider domain expertise, a pre-existing community)*

3. The Business Engine

How does the money and value flow?

A. Revenue Streams: *(How will you charge for this? e.g., Commission per transaction, monthly subscription, flat fee)*

B. Cost Structure: *(What are the fixed and variable costs to run this at a basic level? e.g., Travel costs, basic software subscriptions, manual labor hours)*

C. Key Metrics: *(What 1-2 numbers will tell you if the business model is actually working? e.g., Number of paid transactions per week, customer retention rate)*

1. _____
2. _____

[Page 1 End]

Execution Reality Check: The "When"

4. Assumption Mapping

Every business plan is a list of untested assumptions. We must test the riskiest ones first.

List your top 3 assumptions required for this business model to work: (e.g., "Farmers are willing to wait 5 days for payment," or "Consumers will pay a 20% premium for certified organic.")

1. _____
2. _____
3. _____

The Reality Check: Which of those assumptions has the **highest impact** if you are wrong, but you currently have the **least evidence** that it is true? (*This assumption becomes the entire focus of your Phase 1 MVP*).

The Riskiest Assumption to Test First: >

5. The MVP Phasing Staircase

Do not build a platform until you have validated the demand manually.

Phase 1: The Concierge Test (Validation Phase) Goal: *Do it entirely manually for your first customer to prove they will pay. (What is the cheapest, fastest way to manually deliver the core value this week?)*

Action Plan: >

Timeframe to Launch: _____

Phase 2: The Wizard of Oz (Process Phase) Goal: *Fake the automation. The front-end looks real, but you do the work manually in the background. (How will you handle 10 customers without writing custom code? e.g., WhatsApp Business + Google Sheets + Manual matchmaking)*

Action Plan: >

Trigger to start Phase 2: (e.g., When we successfully complete 3 Concierge transactions)

Phase 3: The Minimum Viable Architecture (System Phase) Goal: *Build the absolute minimum tech required to automate the bottlenecks from Phase 2. (What is the first piece of technology actually required to scale from 10 to 100 customers?)*

Action Plan: >

Trigger to start Phase 3: (e.g., When the manual process breaks because of too much volume)

Example of a Filled-Out MVP Staircase

To tie this back to the heirloom rice market linkage problem we defined earlier, here is how the execution phases should look for an agripreneur:

The Riskiest Assumption: Consumers are willing to pay a ₹40/kg premium for authentic, traceable Kalabhatti rice directly from the farmer.

Phase 1: The Concierge Test: Call 5 potential buyers. Personally drive to the farmer, pick up 50kg of Kalabhatti rice, and deliver it to the buyers to collect the premium price. (Timeframe: Next 7 days).

Phase 2: The Wizard of Oz: Set up a simple free Google Form for buyers to place orders. Once a week, bulk-order the rice from the farmer, use a local courier to deliver, and track the margins in Excel. (Trigger: When the first 5 buyers ask to reorder).

Phase 3: The Minimum Viable Architecture: Build a basic Shopify or WooCommerce storefront integrated with a local logistics API to handle automated ordering, payments, and shipping notifications. (Trigger: When manually coordinating the courier deliveries takes more than 15 hours a week).
